                                                                                                                                                                                                                                                                                                                                                                                                                                                          circumsporozoite protien (CSP) of Plasmodium falciparum strain 7GB, an amino acid Arg created by the cloning procedure, four amino acids, pro-Val-Thr-Asn, representing the four carboxy terminal residues of hepatitis B virus (HBV), adw serotype, pres2 protein, and a stretch of 226 amino acids specifying the S protein of HBV, adw serotype. This protein, and RTS* (see also AAR37797), may be combined with adjuvant and used in a vaccine for preventing plasmodium infections. The vaccines produce a humoral response and also a cellular immune

This is the amino acid sequence of a recombinant protein comprising amino acids 1613-1705 of the Plasmodium falciparum merozoite surface protein 1 (MSP1) 19 kD C-terminal fragment (p19), linked to a glycosylphosphatidylinositol membrane anchoring sequence. p19 is the C-terminal fragment of the 42 kD MSP1 from Plasmodium species. The recombinant protein can be used for the production of anti-malarial vaccines, where the p19 fragment provides a high level of protective immunity since it includes epitopes not presented in the p42 fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /note= "amino acids derived from P. falciparum MSP1 p19 fragment"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ŏ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             5
                                                                                                         This sequence represents the RTS* hybrid protein which is encoded by the RTS* expression cassette. This hybrid consists of a methionine created derived from S. cerevisiae TDH3 gene sequence, three amino acids. Met-Ala-Pro, derived from a nucleotide sequence created by the cloning procedure used to construct the hybrid gene, a stretch of 189 amino acids representing amino acids 210 to 398 of the circumsporozoite protien (GSP) of Plasmodium falciparum strain NFS4, an amino acids Arg created by the cloning procedure, four amino acids, or amino acids Arg. representing the four carboxy terminal residues of hepatitis B virus (HBV), adw sercype, pres2 protein, and a stretch of 226 amino acids specifying the S protein of HBV, adw sercype. This protein, and RTS (see also AAR37796), may be combined with an adjuvant and used in a vaccine for preventing plasmodium infections. The vaccines produce a humoral response and also a cellular (mmune).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             96..116

This is the amino acid sequence of a recombinant protein comprising amino acids 1613-1705 of the Plasmodium falciparum merozoite surface protein 1 (MSP1) 19 kD C-terminal fragment (p19), linked to a glycosylphosphatidylinositol membrane anchoring sequence. p19 is the C-terminal fragment of the 42 kD MSP1 from Plasmodium species. The recombinant protein can be used for the production of anti-malarial vaccines, where the p19 fragment provides a high level of protective immunity since it includes epitopes not presented in the p42 fragment.
                                                                  Recombinant protein containing Plasmodium merozoite surface protein-1 p42 fragment - useful in antimalarial vaccines, also new antibodies for diagnosis and protein purification
                                                                                                                                                             Disclosure; Fig 1B; 85pp; French.
